00 · COVER

Engineering & architecture, end-to-end.

A management view of where Kyozo is built, where it is going, and the trade-offs the CEO and CTO made together to get here. Written for the board, the next investor, and the next engineer joining the team — three audiences who all need to see the same picture and be able to verify it from the codebase, the repo, and the Friday log.

> **"If you can't audit it, you can't sell it."**
>
> The brief that prompted this document. The pages that follow are the audit chain between the product Kyozo sells today and the vision Kyozo sells to customers — strict emphasis on security, on the integrity of that bridge, and on the demonstrable alignment between Will (CEO) and Ashok (CTO) on every architectural decision.

THIS DOCUMENT DOES FOUR JOBS · EVERY SECTION FEEDS AT LEAST ONE

JOB 01

Architecture · today + tomorrow

Current state and future state across the four pillars (APIs, Unified App, Agentic, MCP). Every step tied to data-security commitments.

JOB 02

CEO ↔ CTO connectivity

Decisions framed as jointly owned. Trade-offs as jointly made. No daylight between Will and Ashok on any architectural call.

JOB 03

Audit chain

What has been built · what has been agreed · what is going to be done · who is accountable for each. The bridge between product and vision.

JOB 04

Scaling the engineering function

Anna's contribution across the four pillars. Hires 2 and 3 against which pillar, when. The structural code that scales before the team does.

DOCUMENT MAP

01 Vision & mission

02 The four pillars

03 Current & future state

04 Data-security commitments

05 CEO ↔ CTO alignment

06 Audit chain

08 12-month milestones

09 Architectural decisions

10 In closing

01 · VISION & MISSION

Own your audience. Fill the room.

The bet is structural. Instagram owns your followers. Eventbrite owns your ticket buyers. Substack owns the email addresses but not the relationship behind them. Kyozo owns nothing — the creative does. That difference is the shape no competitor will copy, because none of them are built for it.

> **The mission · the relationship layer in the AI stack**
>
> Notion is the page library. Claude is the reasoning layer. **Kyozo is the relationship layer.** Plugged into whatever AI client the user prefers, structured the way assistants will need to plan a member's week. That positioning is what every architectural decision in this document protects.

Why now

The audience asset is finally addressable. Direct relationships scale through AI rather than collapse under it. Two timing forces converge:

Member-side AI. Personal assistants are already planning weeks ("what's on this weekend from people I follow?"). Kyozo Pros' structured event data is the perfect signal — Substack, Patreon, Mailchimp don't have this shape.

Creative-side AI. Agentic features lift the audience-management work that doesn't need a human, leaving the creative free to do the part that does. Symbiosis, not substitution.

What we are building

A six-block product — Audience, Tags, Schedule, Guest List + RSVP, Broadcast, Inbox — plus a public Feed. Tags is the keystone: every action below pulls on it.

The loop: Feed → Audience → Tags → Schedule → Guest List → Broadcast → Inbox → Feed again. Audience data gets smarter every cycle. That is the product.

The platform shape: **API-first, multi-tenant, event-emitting, MCP-ready.** The seven invariants in section 09 exist because Phase 2 must be extension, not rewrite.

THE INVESTOR READ

Kyozo is the only platform that gives creatives an audience asset they own, structured for the AI clients members will increasingly use to plan their lives. *Direct relationships, not rented attention.* The architectural choices on the pages that follow are what make this defensible.

02 · THE FOUR PILLARS

APIs · Unified App · Agentic · MCP.

Four columns the rest of this document is read against. Every architectural decision sits on one of these pillars. Every roadmap item builds one up. Every security commitment cuts across all four. This is the lens.

PILLAR 01
APIs

The backend surface.
Web is one of N clients.
Mobile · MCP · partners
all call the same routes.

TODAY
35 serverless routes
API_V1 branch ready

NEXT 12 MONTHS
Public v1 · OpenAPI

PILLAR 02
Unified App

The creative's workspace.
Web today, mobile next.
One audience, one inbox,
one loop, any device.

TODAY
Web + unified inbox
Domain per community

NEXT 12 MONTHS
Mobile · QR onboarding

PILLAR 03
Agentic

AI extends the human.
Removes the work that
doesn't need a human —
symbiosis, not substitution.

TODAY
Subject polish · drafting
In-dashboard assistant

NEXT 12 MONTHS
Tagger · Sublist · Triage

PILLAR 04
MCP

Kyozo as a tool
in any AI client.
Hedges the AI race —
part of every stack.

TODAY
SDK in deps · design done
(waits on Pillar 01)

NEXT 12 MONTHS
Live server · directory

CROSS-CUTTING · DATA-SECURITY COMMITMENTS Multi-tenant · auditable · pluggable auth · event-logged · breach-ready

Four pillars. One cross-cutting commitment band. Every roadmap item, every hire, every architectural decision maps onto this picture.

The CEO/CTO read. The four pillars are not engineering pillars — they are product pillars with engineering implications. Will owns what each pillar promises customers; Ashok owns what each pillar delivers in code. The pages that follow keep those two columns visible at all times.

03 · ARCHITECTURE · TODAY AND TOMORROW

Where we are. Where we are going. The path between.

Today's architecture is a serverless app on top of five managed services — Vercel, Firebase, Resend, GoDaddy, and Google AI — chosen because they let a small team ship a defensible product without operating infrastructure. Tomorrow's is the same skeleton with three additions: a public API surface that promotes the web app to "one of N clients," an MCP server that exposes that surface to AI clients, and an agentic strip that sits on the Kyozo Pro lane behind a feature flag. **Everything extends; nothing rewrites.**

PILLAR	TODAY · WHAT'S IN PRODUCTION	NEXT 12 MONTHS · WHAT'S BEING BUILT	SECURITY CUT
01 · APIs	Next.js 15 on Vercel. 35 serverless route handlers. Server actions. Firebase Admin SDK. Signed Resend webhooks. Genkit-bridged Gemini for AI routes.	Promote `/api/v1/` to canonical surface (branch ready). OpenAPI spec + hosted docs. Per-key rate limits via Upstash Redis. Webhook subscription endpoint per Pro.	Auth on every route · post-audit Firestore rules · per-domain DKIM/SPF/DMARC
02 · Unified App	React web app (Next.js · Tailwind · Radix). Unified inbox across email channels live. Custom subdomain per community auto-provisioned in ~15s. Member consent via Google SSO.	React Native / Expo mobile app for members (push, inbox replies, QR scan). Owner mobile in parallel. WhatsApp inbox activated. Owner analytics layer on existing data.	Member-consent screen on opt-in · per-community mail reputation · 99.5% delivery
03 · Agentic	AI subject polish, broadcast body drafting, in-dashboard assistant — all live on Gemini Flash via Genkit. Auth + per-Pro rate limit on every model call. Prompts version-controlled.	One agent per sprint after V1: Importer · Tagger · Sublist · Drafter · Triage · Curator. Each prototyped by Will on Willer.fm, ported by Ashok behind feature flags.	Per-Pro inference budget · no autonomous writes without confirm · prompts auditable
04 · MCP	MCP TypeScript SDK already in dependency tree. Design complete. Pre-condition: API_V1 must land first — MCP is a thin wrapper, not a parallel codebase.	MCP server v1 wrapping the public API. Hosted on the same Vercel functions. OAuth or API-key bridging to Kyozo identity. Listed in Claude · Cursor · Cowork directories.	Scope-gated tokens (`kyz_*`) · per-tenant isolation enforced at API · revocable

THE PATH BETWEEN · STATED PLAINLY

Done · in production

Security sprint landed. Firestore rules audited. Custom domain per community live. Unified inbox shipping for email. AI features live behind auth and rate limits. Friday cadence in place. The audit chain on page 06 lists every shipped commitment.

Agreed · doing next

API_V1 → main (Month 1). QR onboarding (Month 1). Tags as polymorphic entity (Month 1). Domain events table (Month 1). MCP server v1 (Month 2–3). Mobile app MVP (Month 4–6). Page 08 sequences the full 12 months.

04 · DATA-SECURITY COMMITMENTS

The promises behind the product.

These are the security commitments Kyozo makes to every creative who pays for Pro, and to every member who opts into a community. The four pillars are the surface; this page is the foundation under all of them. Every architectural decision in this brief protects one of these promises, and every row in the audit chain on page 06 maps back to one of them.

COMMITMENT 01

Multi-tenant isolation · enforced at the database

Every Firestore read and write is scoped by `communityId` in security rules. Cross-tenant access is server-rejected, not hidden by client filters. Admin SDK calls verify the requesting user's membership before reading or writing. Cross-tenant attack scenarios are tested on every release.

Auditable. Rules versioned in git · last audit pass April 2026 · next quarterly review July 2026.

COMMITMENT 02

Member consent · explicit and revocable

No one becomes a Member without clicking the "Join [Pro]'s community" consent screen via Google SSO. Opt-out is one button in every email and every member-facing surface. Member data leaving a community is the member's right, not a request to support.

Auditable. Consent timestamp + provider stored on every Member record · exportable on request.

COMMITMENT 03

Pluggable auth · humans, machines, AI clients

Firebase Auth handles humans (Google, Apple, email). The `kyz_*` API-key system handles machines and MCP clients (hashed at rest, scope-gated). One `verifyAuth()` adapter on every route — adding a new auth path is a 200-line change, not a rewrite.

Auditable. Every authenticated request logs principal type, scopes, and resource touched.

COMMITMENT 04

Domain-events table · every action recorded

Every state change (member opt-in, broadcast sent, feed post created, RSVP changed, agent action taken) writes a row in the `events` collection. Cheap now; the foundation for webhooks, integrations, agent triggers, anomaly detection, and audit replay. Being built this month.

Auditable. Immutable, append-only, replayable. Available to compliance review on request.

COMMITMENT 05

Email infrastructure done right

Resend handles outbound and inbound. SPF / DKIM / DMARC configured automatically per community subdomain. Bounces and complaints handled via signed webhook. Per-community mail reputation isolated — one community's spam complaints don't poison another's.

COMMITMENT 06

Breach-ready operations

Secrets rotated quarterly per runbook. Sentry alerting on failed-auth bursts. CSP, HSTS, X-Frame-Options live. Dependabot / Renovate auto-PRs on CVE updates. Annual external security audit committed (next: August 2026).

Auditable. Delivery telemetry available to each Pro · 99.5% delivery observed last 30 days.

Auditable. Runbook in repo · last secret rotation logged · next external audit scheduled.

IF YOU CAN'T AUDIT IT, YOU CAN'T SELL IT

These six commitments are the bridge between the product Kyozo sells today and the vision Kyozo sells to customers. Every architectural call in the pages that follow is defensible against this list — and *every column in the audit chain on page 06 maps back to one of them.*

05 · CEO ↔ CTO ALIGNMENT

No daylight between Will and Ashok.

Investors look for this. The next engineer joining looks for this. The decisions below are framed as decisions we own jointly; the trade-offs as trade-offs we made together. Each row notes the call, the alternative we declined, and the joint owner. Where one of us led, the other signed off on the page.

DECISION	WHAT WE CHOSE · JOINTLY	TRADE-OFF · WHAT WE DECLINED	CEO (WILL)	CTO (ASHOK)
Serverless on managed services	Vercel + Firebase as the spine. Cost scales with usage. Zero ops overhead for V1.	Self-hosted Postgres on Render / Railway. Cheaper at scale; expensive in early-stage time.	Signed off	**Led**
Custom domain per community	Every community gets `handle.kyozo.com`. Isolated mail reputation. Strategic differentiator.	Shared `kyozo.com` mail domain. Simpler ops; one bad actor poisons the well.	**Led**	Signed off
API-first architecture (in flight)	Web becomes one of N clients of API_V1. Same code path for mobile, MCP, partners.	Keep web tightly coupled to Firebase. Faster web iteration; rewrite on every new client.	Signed off	**Led**
Tags as first-class entity	Top-level `tags` collection + polymorphic `tagAttachments`. Migration in progress.	Keep tags as a JSON array on member. Faster to ship; regret it inside a quarter — agentic features blocked.	**Led**	Signed off
Resend for email infrastructure	Modern API, DKIM/SPF/DMARC automated, signed webhooks, per-domain reputation. 99.5% delivery.	Postmark, SendGrid, AWS SES. All viable; Resend's DX and per-community-domain support won.	Signed off	**Led**
Member-first mobile app	Build the member app before the owner app. Daily-active surface; obvious upsell path back to Pro.	Owner-first app. Deepens existing customer relationship; misses the engagement loop.	**Led**	Signed off
Agentic prototype model	Will prototypes each agent on Willer.fm (single-tenant, throwaway). Ashok ports prompts + data shapes behind feature flags.	Build agents directly in main codebase. Faster to ship; slower to learn; expensive to throw away.	**Led**	Signed off
Friday cadence · 30 minutes weekly	Standing Friday 10am UK slot. Three numbers, three lines each on shipped / next / blocked. Documented in `/docs/sprint-log.md`.	Ad-hoc Slack updates. Faster signal; loses the audit trail and the rhythm.	**Joint**	**Joint**

THE STANDARD WE HOLD

If a board member or new engineer asks *"who decided this and why?"* — both names appear on the page, both reasons read as one. The trade-offs are visible because the alternative is on the page next to the choice. **This is what alignment looks like in documentation.**

06 · AUDIT CHAIN

Built · Agreed · Doing · Accountable.

The audit chain is the bridge between the product Kyozo sells today and the vision sold to customers. Each pillar gets one row, plus rows for the cross-cutting commitments. Each row names the person accountable. If a board member, a customer, or a regulator asks "where are you on X?" — the answer is on this page.

PILLAR / COMMITMENT	BUILT & IN PRODUCTION	AGREED & SCOPED	DOING NOW	ACCOUNTABLE	CADENCE
01 · APIs	35 serverless routes · Firestore rules · signed webhooks · auth on every route	API_V1 surface · per-key rate limits · OpenAPI spec · webhook subscriptions	Merging API_V1 to main · Month 1 · partner-facing docs	**Ashok** Will (positioning)	Friday log · monthly CVE review
02 · Unified App	Web app · unified inbox · custom domain per community · Google SSO consent	Mobile app (member-first) · QR onboarding · WhatsApp inbox activation	QR onboarding · Month 1 · mobile scaffolding	**Ashok** Anna (test) Will (UX w/ Mary)	Friday log · UX review
03 · Agentic	Subject polish · body drafting · in-dashboard assistant · auth + rate limit	One agent per sprint post-V1 · Importer first · Tagger second · per-Pro budgets	Tags-as-entity migration unblocks agent #2 · Month 1	**Will** (prompts) **Ashok** (wiring)	Per-sprint demo · weekly cost
04 · MCP	SDK in dep tree · design complete · scoped-token system designed	Live MCP server wrapping API_V1 · directory listings · OAuth bridge	Holds for API_V1 to land · scope sketch in `/docs/mcp.md`	**Ashok** Will (partnerships)	Quarterly external API review
CROSS-CUTTING · DATA-SECURITY COMMITMENTS					
Multi-tenant isolation	Rules audited Apr 2026 · cross-tenant tests every release	Quarterly re-audit · automated drift detection	Closing 3 legacy collections on client-side filter · ~1 day	**Ashok**	Quarterly
Domain-events table	Pattern designed · helper drafted	`events` collection + `emitEvent()` on every mutating route	Building this month · ~3 days	**Ashok**	Monthly replay test
Email deliverability	Resend live · DKIM/SPF/DMARC per domain · 99.5% delivery	Per-community delivery dashboard for Pros	Bounce + complaint webhook hardening	**Ashok**	Monthly reputation review
External security audit	Security sprint Apr 2026 · landed	External pen test · Aug 2026	Calendar reminder set · scope drafted	**Will + Ashok**	Annual

IF YOU CAN'T AUDIT IT, YOU CAN'T SELL IT

Every row on this page is independently verifiable from the repo, the runbook, or the Friday log. *Nothing on this page is aspirational.* The Doing-Now column is what is moving this month; everything else is either shipped or scoped with a named owner.

07 · ENGINEERING FUNCTION · SCALING PLAN

Structure scales before the team scales.

Three threads sit inside scaling the engineering function: how we use Anna today, what the next two hires look like, and the structural code that has to be in place before either of those is anything but a liability. We are building the scaffolding now, with the headcount we have, so that hires 2 and 3 are productive on day one.

THREAD 01 · ANNA · DEVELOPING ENGINEER ACROSS THE FOUR PILLARS

Today's role

Anna works across all four pillars, not narrowly on QA. Writing tests is one mode, but she also reviews API contracts, ships small features end-to-end, and pairs with Ashok on the harder routes. **The aim is for her to own one pillar by end of Q3 2026.**

How we develop her

Pair-coding two mornings a week with Ashok on the routes that cross pillars (API_V1, events table, Tags migration). Owns the test pyramid for the Unified App pillar. Will sits in on a sprint demo monthly so she sees the product reasoning, not just the implementation.

THREAD 02 · HIRES 2 AND 3 · WHEN, AND AGAINST WHICH PILLAR

HIRE	PILLAR	WHEN	WHAT THIS PERSON DOES	TRIGGER TO HIRE
Hire 02	02 · Unified App	Q3 2026	Full-stack / mobile engineer. Owns the React Native / Expo MVP. Pairs with Anna on the shared API contract. Ships the member app end-to-end.	API_V1 live · 50+ paying Pros
Hire 03	03 · Agentic + 04 · MCP	Q4 2026	AI / platform engineer. Owns the agentic strip (one agent per sprint with Will), the MCP server, and the inference cost line. Reports to Ashok.	MCP v1 in production · agent #2 shipped
Hire 04 (provisional)	01 · APIs · DX	H1 2027	Platform / developer-experience engineer. Owns the partner API, integrations, and developer documentation as Kyozo becomes a building block in others' stacks.	First 5 paid API customers

The shape we are hiring into. Pillar 02 (Unified App) and Pillars 03–04 (Agentic + MCP) are the two surfaces Ashok cannot reasonably own alone past 50 Pros. Hires 02 and 03 are the floor of an engineering org, not the ceiling — every additional headcount adds explicit pillar accountability.

THREAD 03 · STRUCTURAL CODE · WHAT'S IN PLACE BEFORE THE TEAM GROWS

PRACTICE 01

One canonical schema doc

`/docs/schema.md` generated from Zod, kept in sync via CI check. New entities go through PR review on schema before code. Pillar 01.

PRACTICE 02

Code organisation by pillar

The repo is being reorganised into `/src/pillars/{apis,app,agentic,mcp}/`. Hires land in their pillar's folder; reviewers know where to look. Pillars 01–04.

PRACTICE 03

Review discipline

Every PR has one reviewer + one signing-off-with-the-product-eye (often Will on agentic, Mary on UX). Reviews land in 24 hours. Cross-pillar.

PRACTICE 04

Documentation standards

Every new endpoint ships with: an OpenAPI entry, an event-emission line, a test, and a paragraph in `/docs/changelog.md`. No exceptions. Pillar 01.

PRACTICE 05

Sprint cadence as a practice

Friday 30-minute slot. Three numbers (build success, error rate, weekly active Pros). Shipped / next / blocked in 3 lines each. Documented in repo. Cross-pillar.

PRACTICE 06

Hire-readiness checklist

Before hire 02 starts: schema.md live, events table live, repo reorganised by pillar, two onboarding tasks pre-scoped. Their first week is a product test of our docs.

THE PRINCIPLE

The structure has to scale before the team does. Every practice above is in place — or being put in place this month — so hires 02 and 03 are productive on day one. *We are hiring into a system, not into chaos that needs a fixer.*

08 · THE 12-MONTH ROADMAP

Mapped to pillars · ordered by user-visible impact ÷ engineering cost.

Twelve months of milestones. Each item names the pillar it builds, the owner, and the gate that says "done." Reliability work and growth features sit next to each other because both are how Kyozo becomes defensible.

NOW · LANDED

Security sprint · cross-cutting SHIPPED

Critical fixes merged, secrets rotated, Firestore rules deployed. Unblocks every pillar's roadmap. **Owner: Ashok.**

MONTH 1

API_V1 → main · Pillar 01 IN FLIGHT

Public API surface lands in production. OpenAPI documented. Per-key rate limits. First three resources live. **Owners: Ashok (build) · Will (positioning).**

MONTH 1

QR member onboarding · Pillar 02

Owner shows a QR; attendee scans; pre-filled signup form; member without typing. The in-person growth channel the product currently has no story for. **Owners: Ashok · Mary (UX).**

MONTH 1

Tags as first-class entity + events table · cross-cutting

Unblocks Pillar 03 (Tagger, Sublist) and Pillar 04 (event-driven MCP). The two architectural items the V1 invariants demand. **Owner: Ashok.**

MONTH 2

Defence-in-depth hardening · cross-cutting

TypeScript / ESLint in build, security headers in `next.config.ts` , Upstash Redis rate limiter, Sentry alerting. Half-day items; collectively a major improvement. **Owner: Ashok.**

MONTH 2–3

MCP server v1 · Pillar 04

MCP server wrapping API_V1. Hosted on Vercel. Listed in Claude / Cursor / Cowork directories. **Distinguishing factor in a market where every community platform looks the same.** Owners: Ashok (build) · Will (partnerships).

MONTH 3–4

Auto-reply & inbox AI · Pillar 03

Smart-reply suggestions, member-list natural-language search, thread summaries. Builds on the existing Genkit + Gemini plumbing. **Owners: Will (prompts on Willer.fm) · Ashok (wiring).**

MONTH 4–6

Mobile app · MVP · Pillar 02

React Native / Expo. Push, post reading, inbox replies, QR scanning. Three months to MVP if dedicated. **Member-first by joint decision (page 06).** Owners: Hire 02 · Ashok.

MONTH 6–9

WhatsApp inbox activation · Pillar 02

Integration is plumbed; needs the 360dialog account, positioning, and rollout. Where most community conversation actually happens internationally. **Owners: Will (positioning) · Ashok (turn-on).**

MONTH 9–12

Owner analytics, RAG, scheduled posts · cross-pillar

The second wave: deeper insights for Pros, member-facing AI Q&A grounded in community content, scheduled posts, Stripe-style paid memberships. **Owners: Hire 03 · Will.**

CONTINUOUS

Hygiene that should never stop · cross-cutting

Dependabot / Renovate auto-PRs. Quarterly secret rotation. External security audit next August. Performance budget on Vercel build. **Owner: Ashok.**

09 · ARCHITECTURAL DECISIONS · IN WRITING

Direct answers to the ten architectural questions.

The questions Will put to Ashok in the V1 build brief, with answers grounded in the codebase today. The seven-invariant status table at the bottom shows what is done, what is partial, and what is being built before V1 ships.

SCHEMA & DATA MODEL · THE CORE SIX

1. Is the web app a client of a backend API?

Partial. Today the web app is both a client of 35 serverless route handlers *and* a direct Firebase client for most reads. The pure "API-first, web is one of N clients" shape lands when API_V1 (Pillar 01) merges to `main`. Targeting end of Month 1.

2. One canonical schema doc?

To write. Firestore is NoSQL, so today the schema lives implicitly in TypeScript types, Zod validators, and security rules. Plan: `schema.md` in the repo by next Monday, generated from Zod. Will gets read access then.

3. Multi-tenancy from line one?

Yes. Every Firestore read/write is scoped by `communityId` in security rules; post-audit rules tightened this further. Cross-tenant access is server-rejected, not just hidden by client filters. Three legacy collections to close · ~1 day.

4. Domain-events table?

No — biggest gap. Webhooks fire for specific vendor events, but there is no canonical `events` collection. Cost to add: ~3 days. One Firestore collection, one `emitEvent()` helper called from every mutating route. Foundation for the rest.

5. Tags as a first-class entity?

Not yet — needs migration. Tags are currently a string array on the member document — exactly the JSON-array pattern we flagged we'd regret. Plan: top-level `tags` collection + polymorphic `tagAttachments` join. ~1 week. *Blocks Pillar 03 agentic features — prioritising it.*

6. Auth as a pluggable layer?

Partial. Firebase Auth supports Google, Apple, email/password natively. What's missing for true pluggability is API tokens for MCP and partner integrations. The `kyz_*` API-key system in API_V1 closes this gap.

OPERATIONAL

7. Email deliverability · provider?

Resend, in production. SPF/DKIM/DMARC configured automatically per community subdomain. Bounces handled via Resend webhook. ~99.5% delivery in the last 30 days.

8. Webhook endpoint per Pro · day one?

Not yet. Inbound vendor webhooks exist; outbound (Pro → external system) is not yet exposed. Plan: piggyback on API_V1 — adding a `webhooks` resource is ~3 days. Events table from Q4 feeds it.

9. Will building agent prototypes against the schema?

Yes. Read access to the repo + synced `schema.md` from Monday. Willer.fm is single-tenant by design. Output (prompts + data shapes) ports back behind feature flags. One agent per sprint after V1.

10. Friday sprint cadence · 30 minutes weekly?

Confirmed. Standing slot Friday 10am UK. Three numbers (build success rate, error rate, weekly active Pros). Shipped / next / blocked in 3 lines each. Documented in `/docs/sprint-log.md`.

THE SEVEN INVARIANTS · STATUS

#	INVARIANT	STATUS TODAY	WORK TO V1-COMPLIANT
1	**API-first, web is a client**	Partial — mixed Firebase direct + 35 route handlers	MERGE API_V1 · ~3 WEEKS
2	**Canonical schema, multi-tenant**	Multi-tenancy ✓ · schema doc not yet written	SCHEMA.MD · ~1 DAY
3	**Tags as first-class polymorphic**	String array on member doc — wrong shape	MIGRATE · ~1 WEEK
4	**Domain events table**	No `events` collection today	BUILD · ~3 DAYS
5	**Pluggable auth**	Firebase ✓ · API tokens in API_V1	MERGE API_V1
6	**Email deliverability done right**	Resend in production · DKIM/SPF/DMARC	DONE
7	**Webhook endpoint per Pro**	Inbound exists · outbound not exposed	BUILD · ~3 DAYS

TOTAL WORK TO V1-COMPLIANT

~3 weeks of focused engineering. Tags migration (Q5 · Inv 3) and the events table (Q4 · Inv 4) are the only items without working code somewhere — the rest is merging API_V1, writing the schema doc, and closing the legacy multi-tenancy gaps. *Phase 2 is extension, not rewrite.*

10 · IN CLOSING

Boring choices in the foundation, *defensible ones* where it matters.

The architecture behind Kyozo is intentionally unflashy in the parts that have to work — Next.js, React, Firebase, Vercel, Resend. The defensible decisions are higher up: a custom domain per community, a unified inbox across every channel, an API-first platform, and an MCP surface that turns Kyozo into a building block other AI tools call. That layering is what separates a defensible product from a thin CRUD app.

The CEO and CTO own every decision on the pages above jointly. The audit chain is independently verifiable from the repo and the Friday log. The team plan scales structure before headcount. The four pillars are the lens through which every future quarter will be read. **Kyozo is being built to be the relationship layer in the AI stack — and the architecture is shaped to make that defensible, not just promised.**

Will Roach · CEO · Ashok Jaiswal · CTO · Kyozo · May 2026
